Mathematical optimization (alternatively spelled optimisation) or mathematical programming is the selection of a best element (with regard to some criterion) from some set of available alternatives. Optimization problems of sorts arise in all quantitative disciplines from computer science and engineering to operations research and economics, and the development of solution methods has been of interest in mathematics for centuries. In the simplest case, an optimization problem consists of maximiz

Numerical analysis is the study of algorithms that use numerical approximation (as opposed to symbolic manipulations) for the problems of mathematical analysis (as distinguished from discrete mathematics). Numerical analysis naturally finds application in all fields of engineering and the physical sciences, but in the 21st century also the life sciences, social sciences, medicine, business and even the arts have adopted elements of scientific computations.

Indeed, the reason for the importance of the numerical methods that are the main subject of this chapter is precisely that most equations that arise in "real" problems are quite intractable by analytical means, so the computer is the only hope. Despite the above disclaimer, in the next section we will study yet another important

Scientific Computing 1 (4 Credits) This  
course is an introduction to practical  
numerical methods for science and  
engineering. The course is  
complemented with a fully integrated  
computer laboratory, where you learn to  
use available software and to implement  
your own solution methods.
